

Loopwheels are a new type of bicycle wheel designed to make cycling more comfortable. Loopwheels have suspension within the wheel itself: in place of rigid spokes, they have three loop-shaped springs.

The spring system between the hub and the rim of the wheel cushions the rider from bumps and potholes in the road. The springs absorb road noise, reducing vibration through the frame and into the rider's arms and body. Because of

the suspension within the wheel, you can use high-pressure or puncture-resist tyres. So you don't need to rely on fat (and sluggish) tyres to cushion your ride.

We sell Loopwheels already fitted, ready-to-ride, on a Dahon bicycle frame, or as a wheelset to fit yourself, at www.loopwheels.com/shop/

Invented, designed and made in England

Loopwheels are a UK invention: an internationally registered design and patent pending. The springs and wheels are made in Nottinghamshire. We do import some components, as we can't get hold of everything from UK sources, but we are proud of our UK design and manufacture.

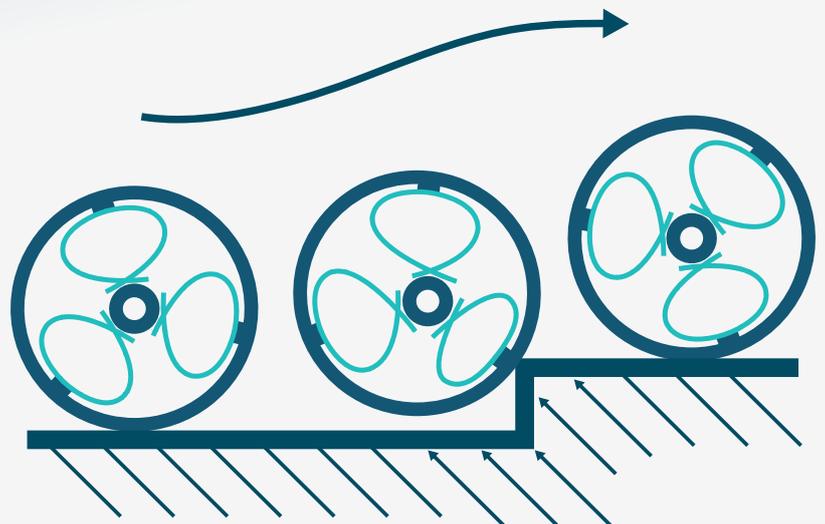

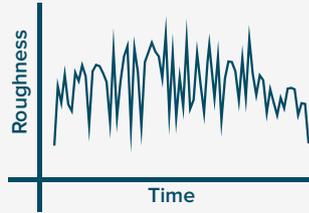

Tangential suspension

Unlike suspension forks, which only work in one plane, Loopwheels provide tangential suspension.

That is, they work in every direction. So they respond to a force hit head-on in the same way as they do to a force from above or below.

This is a new cycling experience, and it feels great!

Spoked wheel over cobble road

Loopwheel over cobble road

Smooth ride, increased comfort

One of the first things people say when they ride with Loopwheels is they don't experience the usual level of vibration ("road noise") through the bicycle frame and up their arms into their wrists and shoulders. This is because the springs in a Loopwheel absorb small shocks from the vibration of the road.

This gives you a really smooth ride - even on a rough surface!

FAQs

What sizes of Loopwheels do you do?

We do 20" Loopwheels. The original has Sturmey Archer hubs, with hub brakes and 3 gears. In 2014, there are two new variants: a derailleur Loopwheel and one with an 8-speed hub gear.

Do you make a 26" or 29" Loopwheel?

We are developing a bigger Loopwheel.

What about 16", and other small wheels?

Smaller wheels are possible - we don't manufacture them currently.

Which bike models do your loopwheels fit?

Dahon Mu Uno. (Plus some other bicycles with

- a 100mm wide front fork
- a 117mm wide rear drop-out
- a radial distance of 260mm from the axle centre to any part of the frame.)

Can I retrofit to my own Dahon?

Yes, to the Dahon Mu frame. You need a 100mm wide front fork (we sell these!)

What about Loopwheels for Bromptons?

We don't make a Loopwheel for a Brompton.

Will Loopwheels work on other vehicles as well as bicycles?

Yes (though we don't manufacture Loopwheels for other applications yet).

What about lateral stability?

A 20" Loopwheel is as laterally stiff as a conventional 26" spoked bicycle wheel.
